
ROAD SIGNS

ROAD SIGNS

PLANNING, INSTALLATION, CONSULTATION

A recent study conducted on the state of road signs in Italy revealed that too often sign interventions in national territory are done haphazardly, contextually demonstrating the main national shortcoming: lack of correct and preventative planning and maintenance of road signs.

ROAD SIGNALING PLAN

The Insico staff can plan and develop, together with the client, a correct signaling plan based on the existing and efficient signs, guaranteeing complete and efficient signage plans in which every visual element is evaluated as a component of a vast and complex whole and not as an individual element.

SIGNAGE INVESTIGATION

Having access to the instruments that facilitate the investigation of signage means facilitating the identification of certain factors that influence the correct installation and placement of road signs. Among these are the management of interventions over time, complementary road signs and markings, compliance with the law as well as the correct planning of said signage.

PROJECT CONSULTING SERVICE

INSICO offers a support service to all national and international entities that need requalification of their signage system, for the realization of new systems as well as regular maintenance. The INSICO technical office develops intervention ideas and realizes complex executive signage projects or single signs, including the survey of the current situation. During the survey phases it is possible to use specific software that can place any signage system in the best way possible on the maps in order to maintain efficiency of the existing road signs.
